(54) Title: **METHOD AND DEVICE FOR DIGITAL BROADCASTING**

(57) Abstract: This invention relates to a broadcasting system/method where a broadcasting signal is encoded on the basis of one or more region codes. During decoding a decryption key and/or a pay-mode key is used where the keys is dependent on a region code representing a physical location of a receiver. In this way, a simple, reliable and efficient way of enabling region dependent broadcasting is obtained. Further, it is possible to have different pay modes dependent on a physical location or region. Additionally, the pay modes may be changed dynamically since only the associations between the region codes and the pay-modes need to be updated.
